

How to download Xspam

✅ Steps to Use the "Email Spam Checker" System via GitHub

◆ 1) Clone the Project from GitHub

Open your terminal or command prompt and run:

bash

Copy

Edit

```
git clone https://github.com/mindctd/Check-Spam-Email.git/your-username/your-project
```

```
cd your-project
```

◆ 2) Install Python & Required Libraries

Make sure Python (v3.8+) is installed.

Then run:

bash

Copy

Edit

```
pip install -r requirements.txt
```

✅ You should create a requirements.txt file containing the libraries used, for example:

nginx

Copy

Edit

pandas

scikit-learn

imaplib

email

tkinter

◆ 3) Configure Gmail IMAP Access

💡 You need to enable IMAP access in Gmail and either:

Allow "less secure apps" (if still available), or

Use an App Password (recommended for 2FA accounts)

Update GmailConnect.py with your credentials inside connect_imap():

python

Copy

Edit

```
def connect_imap():
```

```
    try:
```

```
        mail = imaplib.IMAP4_SSL("imap.gmail.com")
```

```
        mail.login("your-email@gmail.com", "your-app-password")
```

```
        return mail
```

```
    except Exception as e:
```

```
        print("❌ Connection failed:", e)
```

```
    return None
```

◆ 4) Run the System

There are two modes:

✓ Model Testing Mode

Uncomment this line in main.py:

```
python
```

Copy

Edit

```
test_model_with_updated_data()
```

Then run:

```
bash
```

Copy

Edit

```
python main.py
```

🔄 Real Email Checking Mode

Uncomment this line instead:

```
python
```

Copy

Edit

```
listen_for_new_email()
```

◆ 5) GUI Display via Tkinter

When a spam email is detected, the system will call `create_gui()` from `Popup.py` to show a GUI popup alert.
